

**RCAP SOLUTIONS ANNOUNCES PRIVATE WELL ASSESSMENT PROGRAM**  
*Complimentary service available to assist local homeowners*

RCAP Solutions, Inc. is currently seeking local homeowners interested in learning more about the quality of their water and the condition of their well. Unlike public drinking water systems, private wells do not have experts regularly checking the water's source and its quality before it is sent to the tap. Households that use private wells must take special precautions to ensure the safety of their drinking water.

RCAP Solutions can provide local well owners the opportunity to have a free, on-site professional review of their well head and the recharge area, and determine well maintenance needs. Well vulnerabilities will be evaluated based on well specifications, nearby environmental threats, geology, and contamination issues in the area.

When considering well contamination problems and risks, it's important to know what kind of well you have and how it was constructed. Knowing how water gets into your well and from what source will help you understand what you need to do to protect your groundwater source and well from outside influences. RCAP Solutions, Inc. will compile and assess this information for participating private well owners in order to identify potential issues with their wells, including contamination threats.

A step-by-step educational framework has been developed to assist private well owners and other stakeholders in understanding groundwater hydrology, well fundamentals, and well care best practices, and finding assistance locally.

For more information, or if you are interested in participating in the complimentary private well assessment program, please contact Jim Starbard at (978) 502-0227 or email [Jstarbard@rcapsolutions.org](mailto:Jstarbard@rcapsolutions.org) to schedule a consultation. Additional information is also available at [privatewellclass.org](http://privatewellclass.org).

RCAP Solutions, Inc., is a not for profit organization comprised of health professionals, geologists, chemists, engineers, and licensed water operators that are part of a larger network of ground water and drinking water professionals available to provide the necessary resources for participants.

NOTE: This free service does not include water sampling or testing.
